

50+ Projects for Software Engineers

1. Dynamic Pricing Engine for E-Commerce (Flipkart/Amazon-Style)
2. Smart Queue Management System for Hospitals
3. Intelligent Workout Slot Booking System (FlipFit+ Version)
4. Real-Time Fraud Detection Dashboard
5. Version-Controlled Document Management System
6. Interview Question Recommendation Engine
7. Dynamic Notification Scheduler (Custom Cron Builder)
8. Expense Categorization Engine (AI-Lite)
9. SQL Query Optimizer Assistant
10. Event-Driven Inventory Auto-Replenishment System
11. Role-Based Dynamic Menu Rendering System
12. Real-Time Cab Fare Estimation Microservice
13. Multi-Tenant LMS (Learning Management System)
14. SQL Query Execution Visualizer
15. Automated Billing + Subscription Manager (SaaS)
16. Gamified DSA Tracker Platform
17. Cloud File Storage Service (Mini Google Drive)
18. Policy/Rules Engine for HR Leave Application
19. Real-Time Support Chat Backend
20. Database Change Tracking System
21. Smart Recruitment & Candidate Ranking System
22. API Rate Limiting & Quota Management System
23. Real-Time Notification Hub (WebSockets + Queue Simulation)
24. Intelligent Timetable Generator for Schools/Colleges
25. Workspace Booking System (Desks, Cabins, Meeting Rooms)
26. Digital Certificate Verification System
27. Advanced URL Shortener (Analytics + Expiry + Password)
28. Personal Knowledge Base (Notion-Like)
29. Online Exam Proctoring Backend (Cheating Detection)
30. Dynamic Workflow Automation Engine (Zapier-Lite)
31. Multi-Branch Retail Billing System
32. AI-Prompt Template Manager (ChatGPT Prompt Library)
33. Dynamic Resume Builder with Templates
34. Loyalty Points & Rewards Engine (E-Commerce)
35. Multi-Stage Approval Workflow System
36. Real-Time Attendance Tracking System (Geo + QR)
37. Hotel Room Price & Booking Management
38. Data Pipeline Monitoring Dashboard
39. Personal Finance Manager with Auto-Budgeting
40. API Usage Billing System (Pay-Per-Use Platform)
41. Intelligent Course Recommendation Engine (Skill-Graph Based)
42. Distributed Cache Layer With Write-Through Sync
43. IoT Sensor Data Processing Platform
44. Hospital Drug Interaction Checker

45. Custom ETL Pipeline Framework
46. Blockchain-Style Immutable Ledger System
47. Social Media Post Ranking System
48. Multi-Criteria Hotel Recommendation Engine
49. Automated SQL Backup + Restore Manager
50. Interview Analytics Platform for Candidates
51. Real-Time Public Transport Tracking System
52. Distributed Email Sending Engine (High Throughput)
53. Multi-Level Inventory Tracking System
54. Compliance Audit Management System
55. Smart Search Engine With Ranking (Mini Elasticsearch)
56. Vehicle Maintenance Prediction System
57. Online Testing Platform With Anti-Cheat Logic
58. Data Annotation Tool for AI Teams
59. Real-Time Order Tracking System (Like Swiggy)
60. Advanced Query Auditor for SQL Databases

1. Dynamic Pricing Engine for E-Commerce (Flipkart/Amazon-Style)

What this project is

A smart pricing system that automatically adjusts product prices based on demand, stock availability, and competitor price changes — just like real e-commerce platforms.

Features students must build

- Product management (add/edit/delete products)
 - Maintain base price, discounted price, dynamic price
 - Track product demand (views, add-to-cart, purchases)
 - Track inventory levels in real-time
 - Store & update competitor pricing
 - Automated scheduled job that recalculates prices daily/hourly
 - Pricing rules engine (e.g., “if demand ↑ then price ↑”)
 - Price history tracking & analytics dashboard
 - Admin dashboard to monitor price changes
 - Price-change alerts (optional)
-

2. Smart Queue Management System for Hospitals

What this project is

A system that predicts patient waiting time, manages tokens, and gives a real-time view of queues for hospital departments and doctors.

Features students must build

- Patient registration and token generation
 - Queue display for each doctor/department
 - Predict waiting time based on historical data and real cases
 - Live dashboard for doctors to see upcoming patients
 - Patient portal to track their current token status
 - Emergency / priority patient handling
 - Notifications when a patient's turn is near
 - Historical analytics (daily load, avg consultation time)
-

3. Intelligent Workout Slot Booking System (FlipFit+ Version)

What this project is

A scalable system for booking gym workout slots with VIP logic, multi-center support, premium slot access, and surge pricing.

Features students must build

- Multi-location gym center management
- Slot creation (time, capacity, center-specific)
- User types: Normal vs VIP
- Normal user: max 3 slots per day per center
- VIP user: unlimited slots
- Premium slots: only VIP users can book
- Real-time slot availability tracking

- Surge pricing when occupancy crosses a threshold
 - Auto-cancel expired or unused bookings
 - Booking history and analytics
-

4. Real-Time Fraud Detection Dashboard

What this project is

A monitoring system that detects suspicious activity in logins and transactions using rule-based fraud pattern detection.

Features students must build

- Collect login & transaction events
 - Detect patterns like:
 - Multiple failed logins in short time
 - High-value transactions outside user pattern
 - Unusual geo-locations
 - Assign risk score to each user
 - Trigger fraud alerts
 - Dashboard to show:
 - High-risk accounts
 - Count of suspicious events
 - Fraud trends over time
 - Historical fraud insights & analytics
 - Admin can enable/disable detection rules
-

5. Version-Controlled Document Management System

What this project is

A system similar to Git but for documents: maintains every version, computes differences, and allows reverting.

Features students must build

- Upload documents (PDF, text, etc.)
 - Auto-create a new version on update
 - Store history of versions
 - Show difference between two versions
 - Compare any two previous versions
 - Restore content to an older version
 - Document preview
 - Manage editing conflicts (if 2 users edit same file)
 - Activity log of all document changes
 - User roles for access control (viewer/editor/admin)
-

6. Interview Question Recommendation Engine

What this project is

A smart student-focused system that recommends DSA + Language questions based on where students are weak.

Features students must build

- Add/update questions with tags (topic, difficulty)
 - Track student attempts & correctness
 - Identify weak areas (e.g., "Strings", "DP", "Recursion")
 - Auto-generate a personalized quiz every day
 - Recommend questions based on:
 - Weak topics
 - Difficulty levels
 - Past performance
 - Leaderboard + XP system (optional)
 - Performance dashboard showing:
 - Accuracy per topic
 - Difficulty progression
 - Strengths & weaknesses
-

7. Dynamic Notification Scheduler (Custom Cron Builder)

What this project is

A platform where users can create custom recurring schedules (like cron jobs) to receive notifications at specified intervals.

Features students must build

- Create a schedule (e.g., “Every 2 days at 8 AM”)
 - UI for cron-like rule creation (non-technical)
 - Store schedule rules
 - Notification engine to execute rules at correct times
 - Supports email/SMS/push (mock)
 - Retry mechanism for failed notifications
 - Pause/resume/delete schedules
 - Log of all notifications sent
 - Dashboard for upcoming scheduled notifications
-

8. Expense Categorization Engine (AI-Lite)

What this project is

A rule-based system that categorizes bank transactions into categories such as groceries, rent, travel, etc., without using ML.

Features students must build

- Upload bank statement CSV
- Parse transactions automatically
- Rule-based category matching:
 - Keyword rules (“Uber → Travel”)
 - Amount rules
 - Time-based patterns

- Dashboard showing:
 - Monthly spending patterns
 - Category-wise breakdown
 - Biggest expenses
 - User can manually correct categories
 - System learns from corrections to auto-improve
-

9. SQL Query Optimizer Assistant

What this project is

A system that analyzes SQL queries and provides optimization suggestions for better performance.

Features students must build

- Input SQL query
 - Analyze query structure (SELECT, JOIN, GROUP BY)
 - Detect:
 - Missing indexes
 - Redundant conditions
 - Inefficient joins
 - Full table scans
 - Show query execution time (mock or real)
 - Recommend optimizations
 - Explain why a specific index is needed
 - Save past queries for comparison
 - Dashboard to analyze performance trends
-

10. Event-Driven Inventory Auto-Replenishment System

What this project is

An intelligent inventory system that automatically creates purchase orders when inventory is low.

Features students must build

- Product management with min/max thresholds
- Real-time inventory updates (on sale, refund, return)
- Auto-generate purchase order when inventory < threshold
- Triggering events:
 - Sale event
 - Damage event
 - Low-stock event
- Notifications for low stock
- Purchase order workflow:
 - Create PO
 - Approve
 - Receive goods
 - Update inventory
- Inventory analytics dashboard:
 - Fast-moving items
 - Stock-out trends
 - Supplier performance

PROJECT 11 — Role-Based Dynamic Menu Rendering System

What this project is

A backend system that allows the admin to create menus dynamically (like Sidebar/Menu items), assign them to different roles (Admin, Manager, User), and render menus based on permissions.

Features students must build

- Admin login
 - Create dynamic menus (name, icon, URL, parent/child)
 - Role management (Admin, HR, Finance, User, etc.)
 - Assign menus to roles
 - User login → personalized menu based on role
 - Nested menu structure (multi-level)
 - Ability to activate/deactivate menus
 - Audit logs for permission changes
 - Preview mode to test how a role sees the menu
-

12. Real-Time Cab Fare Estimation Microservice

What this project is

A ride-booking backend where fares are calculated in real time using distance, demand, traffic, and surge pricing logic.

Features students must build

- Input: pickup & drop location
 - Calculate distance using predefined distance matrix / API mock
 - Base fare + per km calculation
 - Dynamic surge pricing:
 - High demand
 - Low availability
 - Peak hours
 - Estimate ETA (fake or rule-based)
 - Cache previous fare calculations
 - Book ride → lock fare for user
 - Prevent double-booking through transactions
 - Fare breakdown display (base fare, surge, taxes)
 - Booking history
-

13. Multi-Tenant LMS (Learning Management System)

What this project is

A single system used by multiple institutes/companies, where each tenant has its own courses, users, assignments — all isolated logically.

Features students must build

- Super admin creates tenant (e.g., “College A”, “Company B”)
 - Each tenant has:
 - Its own users
 - Its own courses
 - Its own progress tracking
 - Role-based access (Admin/Instructor/Student)
 - Course creation, modules, lessons
 - Assignment upload + grading
 - Student progress dashboard
 - Tenant-specific branding (logo, theme)
 - Isolation:
Student from Tenant A should not see anything from Tenant B
 - Admin analytics per tenant
-

14. SQL Query Execution Visualizer

What this project is

A tool that takes a SQL query and visualizes how the database executes it — step by step — including execution plan, cost, operations, slow parts, etc.

Features students must build

- Input SQL query via UI/endpoint
- Parse & analyze the query structure
- Display:
 - Execution steps

- Operators (scan, join, filter)
 - Estimated cost
 - Bottlenecks
 - Highlight potential performance issues
 - Suggest improvements:
 - Missing index
 - Avoid "SELECT *"
 - Remove unnecessary join
 - Save query history
 - Compare two queries side-by-side
 - Visual flow diagram of execution
-

15. Automated Billing + Subscription Manager (SaaS)

What this project is

A SaaS-style billing system where users subscribe to a plan and the system handles monthly billing, payment retries, invoices, and reminders.

Features students must build

- Create subscription plans (Basic, Pro, Enterprise)
 - User subscribes to plan
 - Auto-generate monthly invoices
 - Handle failed payments:
 - Retry payment automatically
 - Notify user
 - Subscription lifecycle:
 - Trial → Active → Past due → Cancelled
 - Daily job to process pending invoices
 - Upgrade/downgrade plan logic
 - Billing dashboard for admin
 - Downloadable invoices (PDF if possible)
 - Revenue analytics charts
-

PROJECT 16 — Gamified DSA Tracker Platform

What this project is

A platform for students solving DSA questions, with a gamification layer — XP, badges, streaks like LeetCode/HackerRank.

Features students must build

- Add DSA questions with topic + difficulty
 - User attempts questions → logs correct/incorrect
 - XP system:
 - Easy = 10 XP
 - Medium = 20 XP
 - Hard = 40 XP
 - Streak tracking
 - Badges:
 - “7-Day Streak”
 - “100 Questions Solved”
 - “Master of Trees”
 - Leaderboards
 - Progress dashboard per topic
 - Weekly challenge questions
 - Recommend questions based on weak areas
-

17. Cloud File Storage Service (Mini Google Drive)

What this project is

A backend cloud storage system where users upload files, organize folders, share items, and maintain versions.

Features students must build

- Upload any file (PDF, images, docs)
 - Folder structure:
 - Create folder
 - Move files
 - Nested directories
 - File versioning (each upload creates a version)
 - File sharing:
 - Public link
 - Restricted (specific users)
 - Permission levels (view/edit/download)
 - Activity logs (upload/edit/delete/share)
 - File search by name/type
 - Trash bin + restore system
-

18. Policy/Rules Engine for HR Leave Application

What this project is

A configurable rules engine where HR sets rules for leaves (WFH, sick, casual), and employee leave requests are approved or rejected based on those rules.

Features students must build

- Leave types (WFH, Sick Leave, Casual Leave)
 - Rule builder UI:
 - “Max 3 WFH per month”
 - “You cannot take SL without document”
 - “You cannot take 2 types of leaves together”
 - Employees apply for leave
 - System checks rules dynamically
 - Manager approval workflow
 - Leave balance tracking
 - Monthly leave usage analytics
 - Rule versioning (old rules vs new)
 - Logs for rule violations
-

19. Real-Time Support Chat Backend

What this project is

A backend for a customer support chat like Freshdesk/Intercom with rooms, agent assignment, message history, and read receipts.

Features students must build

- Real-time chat rooms (User ↔ Support Agent)
 - Message sending + receiving
 - Message history storage
 - User typing indicator
 - Seen status ("message seen at 10:32 PM")
 - Agent assignment:
 - Auto-assign agent
 - Transfer chat to another agent
 - Support dashboards:
 - Active chats
 - Resolved chats
 - Online/offline user presence
 - Chat rating after closing (optional)
-

20. Database Change Tracking System

What this project is

A system that tracks every insert, update, delete on a set of monitored tables and shows the change history with visualizations.

Features students must build

- Select tables to monitor
- Track:
 - New rows added
 - Old → new value differences
 - Deleted rows
- Record timestamp + user who changed it

- Show full change history for any record
- Visual timeline of changes
- Export change logs
- Alerts for suspicious modifications
- Admin dashboard with:
 - Most updated tables
 - Rows changed in last 24 hours
 - Summary charts

21. Smart Recruitment & Candidate Ranking System

What this project is

A hiring system where companies post jobs, candidates apply, and the system ranks candidates automatically based on resume score, skills match, and interview performance.

Features students must build

- Job posting and management
- Candidate registration + resume upload
- Resume keyword scoring
- Skill match percentage calculation
- Auto-ranking of candidates
- Multi-round interview tracking
- HR dashboard for candidate status
- Offer letter workflow (draft → release)
- Analytics: best sources of candidates, skills trends

22. API Rate Limiting & Quota Management System

What this project is

A backend system that limits API usage per user or per plan (free, pro, enterprise) with throttling, blocking, and quota resets.

Features students must build

- Create plans (Free: 100 calls/day, Pro: 10,000/day, etc.)
 - Track API calls per user
 - Hard limit (block when quota exceeds)
 - Soft limit (slow down requests)
 - Quota reset every midnight
 - Admin dashboard showing usage per user
 - Alerts for high usage
 - API usage logs & analytics
-

23. Real-Time Notification Hub (WebSockets + Queue Simulation)

What this project is

A centralized backend that pushes notifications (like LinkedIn, Instagram) in real time to users based on events.

Features students must build

- Event types: Follow, Like, Comment, System alerts
 - Real-time notification sending
 - Notification grouping ("5 people liked your post")
 - Mark as read/unread
 - Notification search & filtering
 - User notification preferences
 - Retry mechanism for failed sends
 - Notification history dashboard
-

PROJECT 24 — Intelligent Timetable Generator for Schools/Colleges

What this project is

Automatically generates conflict-free timetables based on constraints like teacher availability, room capacity, and subject requirements.

Features students must build

- Add teachers, subjects, classrooms
 - Set constraints:
 - Teacher not available timings
 - Lab vs classroom requirement
 - Max lectures per day
 - Auto-generate timetable
 - Detect conflicts & suggest fixes
 - Download timetable as PDF
 - Weekly/monthly view
 - Edit timetable manually
 - Version history of timetables
-

PROJECT 25 — Workspace Booking System (Desks, Cabins, Meeting Rooms)

What this project is

A booking platform for hybrid offices where employees reserve desks, meeting rooms, or private cabins.

Features students must build

- Desk/room/cabin inventory setup
 - Real-time availability view
 - Slot-based booking
 - Recurring bookings (daily, weekly)
 - QR code check-in (mock)
 - No-show auto-cancellation
 - Team booking support
 - Admin analytics:
 - Most booked areas
 - Weekly occupancy rate
-

PROJECT 26 — Digital Certificate Verification System

What this project is

A backend platform to generate unique digital certificates with QR codes, verify authenticity, and prevent duplicates.

Features students must build

- Certificate generation (name, course, date)
 - Unique verification ID + QR code link
 - Public verification page
 - Prevent duplicate certificates
 - Certificate templates (basic/professional)
 - Revocation system (invalidate certificate)
 - Certificate search for admins
 - Download certificate as PDF
-

PROJECT 27 — Advanced URL Shortener (Analytics + Expiry + Password)

What this project is

A bit.ly-style link shortener with analytics, expiry rules, and password-protected links.

Features students must build

- Create short URLs
 - Link expiration:
 - Date-based
 - Count-based (max 50 clicks, etc.)
 - Password-protected links
 - Analytics:
 - Click count
 - Browser type
 - Location
 - Time graph
 - QR code generation
 - Admin dashboard for all URLs
-

PROJECT 28 — Personal Knowledge Base (Notion-Like)

What this project is

A mini note-taking and document management system like Notion with nested pages and tags.

Features students must build

- Create pages (title, content)
 - Nested sub-pages
 - Tags & categories
 - Archive/restore pages
 - Version history of edits
 - Page search
 - Favorites/pinned pages
 - Activity logs
-

PROJECT 29 — Online Exam Proctoring Backend (Cheating Detection)

What this project is

A backend for online exams that tracks suspicious activities like tab switching, idle time, and unusual patterns.

Features students must build

- Create exams, schedule, duration
 - Question bank (MCQ/subjective)
 - Live exam session tracking
 - Detect cheating:
 - Tab switching
 - Long idle
 - Too-fast submissions
 - Auto-generate suspicion score
 - Exam submission + scoring
 - Student attempts history
 - Admin dashboard with activity logs
-

30. Dynamic Workflow Automation Engine (Zapier-Lite)

What this project is

A workflow manager where users create flows like: “When a new signup happens → Send email → Create task → Log into DB”.

Features students must build

- Workflow builder (trigger → actions)
- Drag-drop or API-based flow creation
- Predefined triggers (Signup, Payment, Upload)
- Actions (Email, SMS, DB entry, Notification)
- Workflow version history
- Enable/disable workflow
- Execution logs
- Retry failed steps

PROJECT 31 — Multi-Branch Retail Billing System

What this project is

A retail POS system for multiple branches with billing, stock sync, and sales analytics.

Features students must build

- Branch creation
- Manage products & prices
- Generate bills (discounts, taxes)
- Branch-wise inventory sync
- Daily sales summary
- Invoice history
- Low stock alerts
- Branch comparison analytics

PROJECT 32 — AI-Prompt Template Manager (ChatGPT Prompt Library)

What this project is

A system storing reusable prompt templates categorized by domain, role, and use case.

Features students must build

- Add/edit/delete prompt templates
 - Categories (marketing, coding, HR, etc.)
 - Search & filter prompts
 - Star/favorite prompts
 - Versioning of template edits
 - Access control for teams
 - Usage analytics: Most used prompts
-

PROJECT 33 — Dynamic Resume Builder with Templates

What this project is

A resume builder platform that lets users create resumes using predefined templates & auto-generated sections.

Features students must build

- Resume creation wizard
 - Templates (Modern, Minimal, Professional)
 - Auto-generate sections based on user profile
 - Skill rating display
 - Export to PDF
 - Save multiple resumes
 - Shareable resume link
 - Resume analytics (views, downloads)
-

PROJECT 34 — Loyalty Points & Rewards Engine (E-Commerce)

What this project is

A backend system that gives users points on purchase and lets them redeem points during checkout.

Features students must build

- Earn points per purchase
 - Convert points to currency
 - Redeem during checkout
 - Point expiry rules
 - Transaction logs for points
 - Tiered levels:
 - Silver, Gold, Platinum
 - Rewards catalog
 - Points history dashboard
-

PROJECT 35 — Multi-Stage Approval Workflow System

What this project is

A configurable approval system for documents, reimbursements, or proposals with multiple approval stages.

Features students must build

- Create approval workflows
- Define stages (Manager → Finance → Director)
- Submit request
- Approvers review + approve/reject
- Comments & history tracking
- SLA timers (e.g., “must approve in 48 hours”)
- Escalation rules
- Request status dashboard

PROJECT 36 — Real-Time Attendance Tracking System (Geo + QR)

What this project is

A modern attendance system where users mark attendance via QR or location.

Features students must build

- Generate daily QR codes
 - User scans QR to mark attendance
 - Geo-location based attendance
 - Late/early leave tagging
 - Monthly attendance report
 - Leave integration
 - Admin dashboard with insights
-

PROJECT 37 — Hotel Room Price & Booking Management

What this project is

A hotel booking system with dynamic room pricing based on date, occupancy, and demand.

Features students must build

- Room types (deluxe, suite, premium)

- Calendar-based availability
 - Seasonal pricing rules
 - Weekend vs weekday pricing
 - Occupancy-based surge
 - Booking flow
 - Cancellation rules
 - Revenue dashboard
-

PROJECT 38 — Data Pipeline Monitoring Dashboard

What this project is

A system to monitor ETL/data pipelines, track failures, log runtimes, and send alerts.

Features students must build

- Register pipelines
 - Track each run:
 - Status (Success/Failed)
 - Runtime
 - Data volume
 - Error logs
 - Retry option
 - Alerts on failure
 - Dashboard with pipelines overview
 - Performance trends
-

PROJECT 39 — Personal Finance Manager with Auto-Budgeting

What this project is

A finance tool that categorizes expenses, sets budgets, and triggers alerts on overspending.

Features students must build

- Add income & expenses
- Auto-categorization rules
- Monthly budget per category
- Alerts when crossing 80% or 100% budget
- Trend charts
- Savings goals tracking
- Export monthly report

40. API Usage Billing System (Pay-Per-Use Platform)

What this project is:

A backend system that charges users based on how many API calls they make.

Major Features:

- Track count of API calls per user
 - Tiered pricing (free → basic → pro)
 - Rate limiting per plan
 - Monthly invoice generation
 - Auto-disable APIs on unpaid invoices
 - Admin dashboard for usage analytics
-

41. Intelligent Course Recommendation Engine (Skill-Graph Based)

What this project is:

Suggest courses based on user skills and completed modules.

Major Features:

- Skill mapping graph (prerequisites → advanced)
 - Personalized recommendations
 - Course difficulty scoring
 - Dynamic updates when user finishes modules
 - SQL graph structure (adjacency list)
-

42. Distributed Cache Layer With Write-Through Sync

What this project is:

A custom Redis-like in-memory cache system.

Major Features:

- In-memory key-value store
- Write-through + write-back modes
- Cache eviction policies (LRU, LFU)
- Hit/miss metrics
- Async sync to SQL via Spring events

43. IoT Sensor Data Processing Platform

What this project is:

Backend that receives 1000s of sensor readings per minute.

Major Features:

- Async ingestion (Kafka optional or Spring @Async)
 - Time-series SQL storage
 - Threshold alerts
 - Device registration + authentication
 - Dashboard for trends & anomalies
-

44. Hospital Drug Interaction Checker

What this project is:

Given 2 medicines, the system checks if they interact.

Major Features:

- Drug database + interaction mapping
- Rules engine for conflict severity
- Prescription validation
- PDF interaction report generation
- Doctors/admin management

45. Custom ETL Pipeline Framework

What this project is:

A mini-Informatica/Talend where users upload CSVs → system transforms → loads to DB.

Major Features:

- Upload → validate → transform → load
 - Transformation rules (trim, cast, replace)
 - Error records bucket
 - Scheduling ETL jobs
 - Progress tracking + logs
-

46. Blockchain-Style Immutable Ledger System

What this project is:

A backend that keeps immutable transactions in a chain format.

Major Features:

- Block creation with hashing
 - Transaction chaining
 - Tamper detection
 - Version history
 - Admin viewer UI
-

47. Social Media Post Ranking System

What this project is:

A backend that calculates ranking score for posts (like Instagram explore).

Major Features:

- Post scoring based on engagement
 - Weighted ranking formula
 - Trending topics calculator
 - Real-time feed sorting
 - SQL optimized aggregation
-

48. Multi-Criteria Hotel Recommendation Engine

What this project is:

Suggest hotels based on price, rating, distance, and facilities.

Major Features:

- Weighted score per hotel
 - Multiple filters
 - Geolocation + distance calculation
 - Admin can tweak scoring parameters
 - SQL heavy searching & sorting
-

49. Automated SQL Backup + Restore Manager

What this project is:

System automatically backs up DB and allows restore from UI.

Major Features:

- Daily backup scheduler
 - Incremental/differential backup
 - Restore to specific timestamp
 - Disk usage analytics
 - Notifications for backup failures
-

50. Interview Analytics Platform for Candidates

What this project is:

Tracks mock interview performance and identifies weak areas.

Major Features:

- Difficulty scoring for each question
- Weak-topic detection
- Skill progression graphs
- Recommendation of improvement areas
- HR/admin panel

51. Real-Time Public Transport Tracking System

What this project is:

Backend for buses/trains live location + ETA prediction.

Major Features:

- Live location ingestion
 - ETA calculation using historical + current traffic
 - Trip history
 - Geo-fencing alerts
 - Passenger dashboard
-

52. Distributed Email Sending Engine (High Throughput)

What this project is:

A scalable email-sending service (like Amazon SES).

Major Features:

- Email queue
- Retry + dead letter queue
- Batch sending
- Template storage
- Analytics dashboard

53. Multi-Level Inventory Tracking System

What this project is:

Tracks inventory at warehouse → store → sale.

Major Features:

- Stock movement tracking
 - Real-time availability
 - Reorder prediction
 - Multi-level hierarchy mapping
 - Low-stock alerts
-

54. Compliance Audit Management System

What this project is:

Tracks audits, findings, action items, deadlines.

Major Features:

- Audit scheduling
 - Findings with severity scoring
 - Auto reminders
 - Escalation workflow
 - Reports for compliance %
-

55. Smart Search Engine With Ranking (Mini ElasticSearch)

What this project is:

Build your own search engine based on scoring.

Major Features:

- Inverted index structure
 - Search scoring using TF-IDF
 - Auto suggestions
 - Filters + pagination
 - Query analyzer
-

56. Vehicle Maintenance Prediction System

What this project is:

Predict next service date for vehicles.

Major Features:

- Mileage + usage tracking
 - Service interval rules
 - Prediction engine
 - Service center scheduling
 - Maintenance logs storage
-

57. Online Testing Platform With Anti-Cheat Logic

What this project is:

System to conduct online exams safely.

Major Features:

- Random question generation
 - Copy-paste detection
 - Time-bound tests
 - Result analytics
 - Activity logs (tab switch, idle time)
-

58. Data Annotation Tool for AI Teams

What this project is:

Backend for tagging text/images for ML teams.

Major Features:

- Task assignment
 - Label definitions
 - Progress tracking
 - Quality checking system
 - Export to CSV/JSON
-

59. Real-Time Order Tracking System (Like Swiggy)

What this project is:

Track customer orders from creation → acceptance → dispatch → delivery.

Major Features:

- Order lifecycle state machine
 - Live location of delivery agent
 - Delay prediction
 - Notifications for each stage
 - Order analytics dashboard
-

60. Advanced Query Auditor for SQL Databases

What this project is:

Tracks expensive queries and suggests optimizations.

Major Features:

- Slow query detection
- Missing index suggestions
- Query patterns (full table scan, bad joins)
- Historical performance graphs
- Admin report generator
